Scaling field-sales AI agents across the EU

Proposal to the Board of Big Pharma AG

Scaling the field-sales agents across the EU adds about €51m of EBIT a year from 2028

Run-rate EBIT impact in 2028 across nine EU markets and about 2,400 field reps; 5-year NPV of €168m in the base case

1. Value

The agents free **3.5 hours per rep per week** from call notes and preparation, which converts into more customer calls, and next-best-action raises conversion on suggested visits. Net of AI run cost of **€12m a year** and an adoption haircut, 2028 EBIT rises from a momentum case of **€375m** to **€426m**.

2. Evidence

An eight-week pilot with 40 reps in two regions delivered **14% more calls, 5% higher conversion** on suggested visits and **zero compliance incidents** across **2,900** generated call notes. **78%** of pilot reps used the agent daily by week four.

3. Conditions

Value depends most on rep adoption: benchmarks show daily use can fall **15 to 20 points** after a pilot without active support. Two of nine markets need CRM data remediation before rollout, and the works council requires an opt-out from individual usage reporting.

Recommendation: approve wave 1 (Germany and Italy) now and release later waves only when daily use stays above 70% by month four.

The pilot proved the value: 14% more calls, 5% higher conversion and zero compliance incidents

40 reps in two regions against a matched control group, 24 August to 18 September 2026

Measure	Pilot result	Source	What it means for scale-up
Customer calls per rep per week	**+14%** vs control	Pilot telemetry	Freed admin time turns into selling time, the largest value lever.
Conversion on suggested visits	**+5%** vs control	Pilot telemetry	In line with the 3 to 8% reported by six benchmark programmes.
Admin time freed per rep	**3.5 hours** per week	Rep survey, n = 38	Sizes the call lever at about 2,400 reps across nine markets.
Daily use by week four	**78%** of reps	Rep survey, n = 38	Strong start, but adoption is the main risk after the pilot.
Medical-legal review time	**9 to 4 hours** per item	Compliance review log	Lowers review effort as content volumes grow.
Compliance incidents	**0** in 2,900 notes	Compliance review log	Guardrails hold at pilot scale and are ready to extend.

Key observations

Personalised content raised open rates, but the follow-up effect was **not significant after six weeks**, so the content lever is kept small in the business case.

The pilot ran in two regions only; the scale-up keeps the same guardrails and adds a weekly human review of a 5% sample.

Adoption needs active support: a former head of sales operations expects a **15 to 20 point drop** without it.

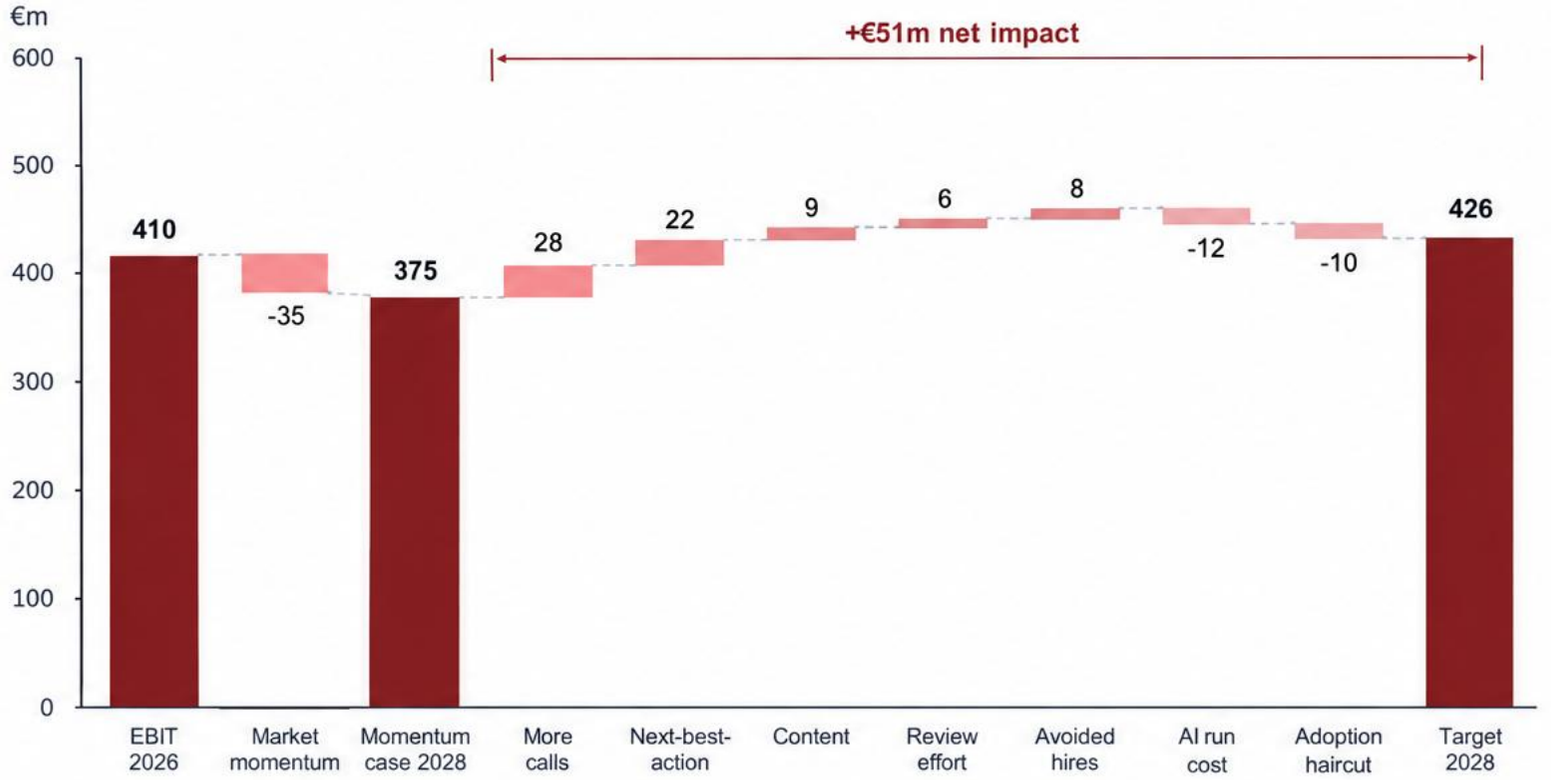

Sources: pilot telemetry, rep survey (n = 38), medical-legal review log; Big Pharma AG and project team, 2026

The scale-up lifts 2028 EBIT to €426m, €51m above the momentum case, and holds even at 55% adoption

EU commercial EBIT, €m, run-rate 2028; 5-year NPV €168m in the base case, with 83% adoption at scale

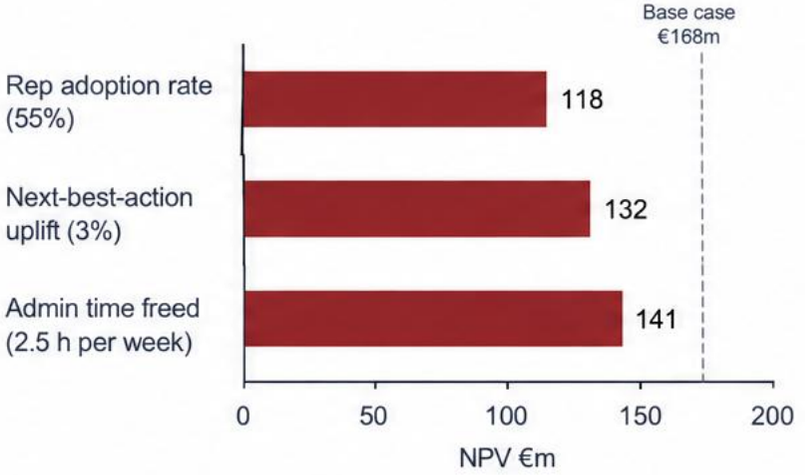

2028 EBIT bridge

EU commercial EBIT, €m, from 2026 to 2028 run-rate

Sensitivity

5-year NPV, €m, one input at a time; base case €168m

Rep adoption moves NPV most: at 55% adoption NPV is still **€118m**.

No single input turns NPV negative; one-off rollout investment is **€12m**.

Momentum case = 2028 EBIT without the agents. Levers sized from the two-region pilot; the adoption haircut applies to the call, conversion and content levers.

Seven of nine markets are ready now, and the remaining risks are manageable with gated waves

Two markets have more than 30% of doctor records incomplete; they move to the last wave after remediation

Nine EU markets:
7 ready, 2 need CRM remediation

Risk or condition	What the evidence shows	Mitigation in the rollout	Status
CRM data quality	Two markets have **more than 30%** of doctor records incomplete	Remediate before their wave; start them last	Gated
Rep adoption after the pilot	78% daily use in the pilot; benchmarks show a **15 to 20 point drop** without support	Floor-walkers in every cohort; release next wave only above **70% daily use**	Gated
Compliance of generated content	**Zero incidents** in 2,900 notes; review time fell from 9 to 4 hours	Same guardrails at scale plus weekly review of a 5% sample	Managed
Works council acceptance	Opt-out from individual usage reporting is required in Germany	Aggregate usage reporting with an individual opt-out, agreed before wave 1	Open
Rollout duration	Comparable programmes took **12 to 20 months** across six to ten markets	Three waves over 18 months with a gate between each	Managed

We ask the Board to approve wave 1 now and release waves 2 and 3 on adoption gates

Three waves over 18 months; each wave starts only when the previous one meets its evidence gate

The decision we ask for

Approve wave 1 in Germany and Italy and the €12m one-off rollout investment.

Agree the 70% daily-use gate for releasing wave 2.

	Wave 1	Wave 2	Wave 3
Markets	Germany and Italy	The five further markets that are ready now.	The two markets after CRM data remediation.
Timing	Proposed months 1 to 4	Proposed months 5 to 11	Proposed months 12 to 18
Scope	About **900 reps**, the three pilot agents, CRM integration and guardrail sign-off.	Rollout in cohorts with floor-walkers and weekly adoption reviews.	Rollout and handover of the run model to Big Pharma AG.
Gate to the next wave	Daily use above **70%** by month four.	Adoption held and CRM remediation complete in the last two markets.	Run model operated without external support.

One-off investment **€12m**; run cost about **€12m** a year at full scale; wave-1 rollout support **€886k** in professional fees over 16 weeks
